2		2411it010063	C.Anjani
3		2411it010067	C.Sai Kiran

Guide Name: Mrs.G.Devi Priya**Abstract:**

Financial document tampering is a serious challenge for banks, insurance companies and businesses, and manual verification is slow and error-prone. This project presents FinDoc AI, an explainable system that detects tampered receipts and invoices, trained and evaluated on the public "Find it again!" dataset of 988 scanned receipts with separate training, validation and testing splits. Error Level Analysis re-saves each page as JPEG and finds text regions whose compression error differs from the rest of the page, which is typical of pasted, re-typed or painted-over content. An EfficientNetV2B0 model trained on ELA maps examines the most suspicious regions, and Grad-CAM heatmaps with a plain-language list of reasons explain every decision. Typed Word, PowerPoint and digital PDF files are checked through their metadata. The web application is developed with Flask, HTML, CSS and JavaScript and accepts images, camera photos, PDF, Word and PowerPoint files. On 218 test receipts the system reaches 71.10% accuracy and a document-level AUC of 79.16%, detecting 23 of 35 tampered receipts, and serves as an explainable screening aid for secure document verification.
